

KEY TERMS AND HELPFUL GUIDES TO SHARPENING WOODCARVING TOOLS

EDGE:

THE USUALLY THIN SHARPENED SIDE OF THE BLADE OF A CUTTING INSTRUMENT.

Wire Edge:

A FEATHERY STRIP OF METAL THAT IS CREATED WHEN SHARPENING.

Line of Sight:

A REFLECTION OF LIGHT THAT YOU SEE AFTER YOU HAVE GROUNDED A BROKEN, CHIPPED, OR DULL EDGE.

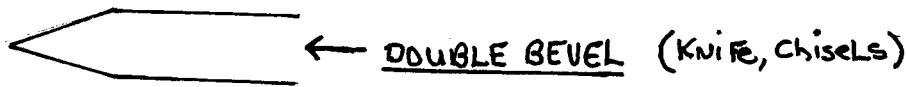

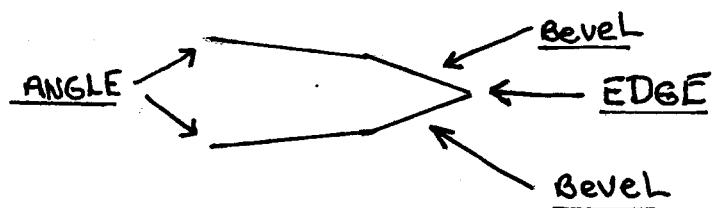

THE LINE OF SIGHT SHOULD BE AS CONSISTENT AS POSSIBLE BEFORE RESHARPENING.

Angle:

TWO LINES DIVERRGING FROM A GIVEN POINT.

BEVEL:

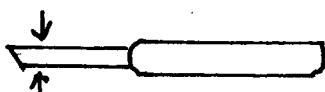

ANGLE OR INCLINATION OF A LINE THAT MEETS ANOTHER AT ANY ANGLE BUT 90 DEGREES.

Thickness:

Width:

Something To Consider:

The Shallower The Bevel The Easier The Tool Slides Through The wood,
But they ALSO give you A weaker Edge. The shallower Edge is
GREAT FOR SOFT woods (BASSwood, pine), But you will Need To
Resharpen more OFTEN For hardwood (OAK, WALNUT). IT IS
Best To use A steeper Bevel For HARDwoods.

BLADE Profiles:

Chisels, Gouges, V-tools:

ROUNDED BEVEL

HOLLOW GROUND BEVEL

FLAT BEVEL

KNIVES:

GROUND Completely FLAT

SLIGHT RADIUS or Rounding

Thickened BLADE

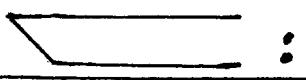

NOTE:

A ROUNDED Bevel makes The TOOL Roll OUT of The CUT prematurely

A HOLLOW GROUND makes The Cutting Edge BRITTLE AND SUBJECT
To quick Dulling

DOUBLE BEVELS CAN BE GROUND AT INCONSISTENT ANGLES WHICH WILL MAKE IT DIFFICULT TO ENTER AND LEAVE WOOD SMOOTHLY

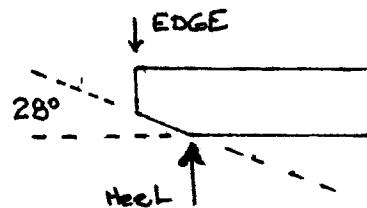

SKEW

- Comes with a SINGLE or DOUBLE BEVEL (Note: DOUBLE BEVEL CAN BE USED AS A Right OR Left Skew).
- USUALLY HAS A 10° Angle.
- AVAILABLE WITH Right OR Left Angles
